## 1. Bluetooth Function

### 1.1. Bluetooth Introduction

Bluetooth is a wireless technology standard for exchanging data over short distances (using short-wavelength radio transmissions in the ISM band from 2400–2480 MHz) from fixed and mobile devices, creating personal area networks (PANs) with high levels of security. Bluetooth was standardized as IEEE 802.15.1

### 1.2. Bluetooth Profile

To use Bluetooth wireless technology, a device has to be able to interpret certain Bluetooth profiles, which are definitions of possible applications and specify general behaviors that Bluetooth enabled devices use to communicate with other Bluetooth devices. These profiles include settings to parametrize and to control the communication from start. Adherence to profiles saves the time for transmitting the parameters anew before the bi-directional link becomes effective. There are a wide range of Bluetooth profiles that describe many different types of applications or use cases for devices.

Besides of all profiles, there have four basic ones, they are GAP/SDAP/SPP/GOEP Profile. The profiles supported by SIM800 series exclude SIM800C are SPP, OPP, HSP/HFP, A2DP, AVRCP, PBAP. SIM800C only supports SPP, OPP and HFP/HSP(part function) profiles. SIM800 series exclude SIM800C act as bluetooth earphone and smartphone. SIM800C only acts as Bluetooth earphone.

### 1.3. Bluetooth Device Address

The Bluetooth device address stores the network address of a Bluetooth-enabled device. It is used to identify a particular device during operations such as connecting to, pairing with, or activating the device.

A Bluetooth-enabled device address is a unique, 48 bits address containing the following three fields:

- LAP field: lower part of the address containing 24 bits.
- UAP field: upper part of the address containing 8 bits.
- NAP field: non-significant part of the address containing 16 bits.

The LAP and the UAP represent the significant address part (SAP) of the Bluetooth device address.

### 1.4. AT Interface for Bluetooth Function

As module solution, we provide series of AT interface to operate Bluetooth function, including pairing, bonding, pushing or receiving file.

Also including interface for SPP service, which could communicate between Bluetooth device and others via serial port.

When the module as a Bluetooth headset role, we provide a set of AT commands to control the remote smart phones, such as phone calls, turn on or hang up calls and so on.

By default, the module operates in power-saving mode, which means that the module can be simultaneously connected to a Bluetooth device. When the module to establish a connection with a device, other devices can not be scanned into the module, the module can not get Profile, will not be able to establish new connections and modules. If the customer's application scenario, the module needs to be multiple Bluetooth devices (currently up to three) connection, you need to use the AT + BTSPPCFG = 1 command to turn off the power saving mode. It should be noted that the power saving mode does not affect the module initiative to connect to other Bluetooth devices.

## 5. Differences between bluetooth version and standard Version

*Note: In this chapter, SIM800 BT indicates SIM800 series BT version, SIM800 indicates SIM800 series standard version. Differences among SIM800 series standard version, please refer to chapter 21 for details in doc "SIM800 Series AT Command Manual".*

### 5.1.ATD<str>

SIM800 BT does not support finding number by name.

### 5.2.AT+CPBF

SIM800 BT	SIM800
Max length of <findtext> is always 40 bytes.	Max length of <findtext> depends on AT+CSCS
Results will order by phonebook index when select "SM" or "ME" phonebook, from small to large.	Results will order by the order user inputs phonebooks.
<findtext> must match <text> from the leftmost side, when select "SM" or "ME" phonebook	No this limit
<b>Difference</b>	<b>There are multi difference of AT+CPBF between SIM800 BT and SIM800.</b>

### 5.3.AT+CMUX

SIM800 BT does not support MUX function.

### 5.4.AT+CNUM

SIM800 BT	SIM800
+CNUM: [<alpha>],<number>,<type>,<service>	+CNUM: <alpha>,<number>,<type>,<speed>,<service>
<b>Difference</b>	<b>&lt;alpha&gt; of SIM800 BT does not display if length of &lt;alpha&gt; is 0. SIM800 BT does not support &lt;speed&gt; field and left blank.</b>

## 5.5.AT+CMGS

SIM800 BT does not support sending message by phonebook index or name.

## 5.6.AT+CMSS

SIM800 BT does not support sending message from storage.

## 5.7.AT+CPMS

SIM800 BT	SIM800
AT+CPMS=? +CPMS: ("SM","ME","MT"),("SM","ME","MT"),( "SM","ME","MT")  OK	AT+CPMS=? +CPMS: ("SM","ME","SM_P","ME_P","MT"),("S M","ME","SM_P","ME_P","MT"),("SM" ,"ME","SM_P","ME_P","MT")  OK
<b>Difference</b>	<b>SIM800 BT supports three modes: "SM","ME","MT".            SIM800 supports "SM","ME","SM_P","ME_P","MT" modes.</b>

## 5.8.AT+CHFA

SIM800 BT	SIM800
AT+CHFA=? +CHFA: (0=NORMAL_AUDIO, 1=AUX_AUDIO, 2=HANDFREE_AUDIO, 3=AUX_HANDFREE_AUDIO, 4=PCM_AUDIO,5= BT_CHANNEL)  OK	AT+CHFA=? +CHFA: (0=NORMAL_AUDIO, 1=AUX_AUDIO, 2=HANDFREE_AUDIO, 3=AUX_HANDFREE_AUDIO, 4=PCM_AUDIO)  OK
<b>Difference</b>	<b>Value of parameter &lt;n&gt; has BT audio channel in SIM800 BT.            BT channel can be set when BT link is established and module acts as mobile            phone. After switch to BT channel, local sound can be transferred to BT            earphone. If BT link is disconnected, audio channel will restore to the original            channel and URC +CHFA: &lt;n&gt; is reported. Because the audio service is always            on after switch to BT channel, consumption current is bigger than normal.</b>

## 5.9.TTS function

SIM800 BT which module memory is 32M does not support TTS function.

### A. Reference

ID	Document	Remark

### B. Profile

Profile	Introduction
SPP	Abbreviation of Serial Port Profile, to implement BT serial port function. Module can transmit data to connected BT device through AT+BTSPSEND after successfully applying this profile. The module will receive data report +BTSPDATA in automatic mode, and +BTSPMAN in manual mode.
OPP	Abbreviation of OPP Object Push Profile, to implement pushing BT object. This function is used between the two paired BT devices, AT+BTOPPPUSH to push file, AT+OPACPT to receive the pushed file.
HFP/HSP	Abbreviation of Handsfree Profile/Headset Profile, i.e. BT earphone function. HFP is the enhanced version of HSP, so even if the other BT device just supports HSP, SIM800H still can connect the BT device with HFP. Module's call voice would be displayed from BT earphone after this profile being connected. When the module plays a role as smart phone, BT earphone could control the call operation (e.g. hang up, answer, redial).
A2DP	Abbreviation of Advanced Audio Distribution Profile, which is an advanced protocol for audio frequency distribution. Earphone will activate AVRCP connection after the profile being connected. It is mainly used for BT earphone to transmit Hi-Q audio frequency. If suffixed with source, it means this device is audio frequency source, i.e. plays a role as smartphone.
AVRCP	Abbreviation of Audio Video Remote Control Profile, is AV remote control protocol. This profile depends on A2DP and only could be connected after the A2DP connection is established. It is mainly used for BT earphone to control the media function of smartphone. If suffixed with target, it means this device is controlling target, i.e. plays a role as smart phone.
HFP(AG)	This profile is HFP, i.e. plays a role as BT earphone. After the module connects with smartphone, the call voice of smartphone could be displayed by the module's audio channel. Also the call operation of smartphone can be controlled by those commands such as AT+BTATD, AT+BTATH, AT+BTATA.
HFG	This profile is HFP, but plays a role as smartphone at this moment. After the

	module connected with smartphone,there will display such information indicates profile being connected successfully.If the module plays a role of earphone,then the information displayed after connection will be HFP(AG).
PBAP	Phone Book Access Profile (PBAP) is a profile that allows exchange of Phone Book Objects between devices.
