HEWLETT® PACKARD

2.0 Amp Output Current IGBT Gate Drive Optocoupler

Technical Data

HCPL-3120

Features

- **2.0 A Minimum Peak Output Current**
- **15 kV/μs Minimum Common Mode Rejection (CMR) at V_{CM} = 1500 V**
- **0.5 V Maximum Low Level Output Voltage (V_{OL}) Eliminates Need for Negative Gate Drive**
- **I_{CC} = 5 mA Maximum Supply Current**
- **Under Voltage Lock-Out Protection (UVLO) with Hysteresis**
- **Wide Operating V_{CC} Range:** 15 to 30 Volts
- **500 ns Maximum Switching Speeds**
- **Industrial Temperature Range:** -40°C to 100°C
- **Safety Approval**
  UL Recognized - 2500 V rms for 1 minute per UL1577
  CSA Approval
  VDE 0884 Approved with V_{IORM} = 630 V peak (Option 060 only)

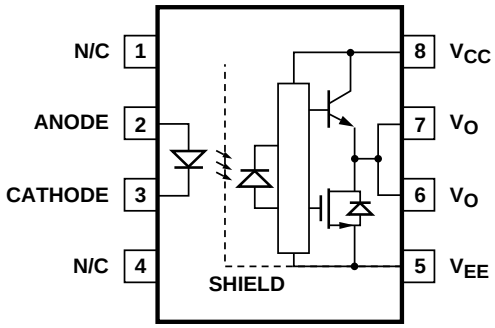
Applications

- **Isolated IGBT/MOSFET Gate Drive**
- **AC and Brushless DC Motor Drives**
- **Industrial Inverters**
- **Switch Mode Power Supplies (SMPS)**

Description

The HCPL-3120 consists of a GaAsP LED optically coupled to an integrated circuit with a power output stage. This optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and current supplied by this optocoupler makes it ideally suited for directly driving IGBTs with ratings up to 1200 V/100 A. For IGBTs with higher ratings, the HCPL-3120 can be used to drive a discrete power stage which drives the IGBT gate.

Functional Diagram



TRUTH TABLE

LED	V_{CC} - V_{EE} "POSITIVE GOING" (i.e., TURN-ON)	V_{CC} - V_{EE} "NEGATIVE GOING" (i.e., TURN-OFF)	V_O
OFF	0 - 30 V	0 - 30 V	LOW
ON	0 - 11 V	0 - 9.5 V	LOW
ON	11 - 13.5 V	9.5 - 12 V	TRANSITION
ON	13.5 - 30 V	12 - 30 V	HIGH

A 0.1 μF bypass capacitor must be connected between pins 5 and 8.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Regulatory Information

The HCPL-3120 has been approved by the following organizations:

UL

Recognized under UL 1577, Component Recognition Program, File E55361.

CSA

Approved under CSA Component Acceptance Notice #5, File CA 88324.

VDE (Option 060 Only)

Approved under VDE 0884/06.92 with V_{IORM} = 630 V peak.

VDE 0884 Insulation Characteristics (Option 060 Only)

Description	Symbol	Characteristic	Unit
Installation classification per DIN VDE 0110/1.89, Table 1

**The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to your equipment level safety specification or HP Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

Notes:

1. Derate linearly above 70°C free-air temperature at a rate of 0.3 mA/°C.
2. Maximum pulse width = 10 µs, maximum duty cycle = 0.2%. This value is intended to allow for component tolerances for designs with I_O peak minimum = 2.0 A. See Applications section for additional details on limiting I_{OH} peak.
3. Derate linearly above 70°C free-air temperature at a rate of 4.8 mW/°C.
4. Derate linearly above 70°C free-air temperature at a rate of 5.4 mW/°C. The maximum LED junction temperature should not exceed 125°C.
5. Maximum pulse width = 50 µs, maximum duty cycle = 0.5%.
6. In this test V_{OH} is measured with a dc load current. When driving capacitive loads V_{OH} will approach V_{CC} as I_{OH} approaches zero amps.
7. Maximum pulse width = 1 ms, maximum duty cycle = 20%.
8. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage ≥ 3000 Vrms for 1 second (leakage detection current limit, $I_{I-O} \leq 5$ µA). This test is performed before the 100% production test for partial discharge (method b) shown in the VDE 0884 Insulation Characteristic Table, if applicable.
9. Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
10. The difference between t_{PHL} and t_{PLH} between any two HCPL-3120 parts under the same test condition.
11. Pins 1 and 4 need to be connected to LED common.
12. Common mode transient immunity in the high state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM}, to assure that the output will remain in the high state (i.e., $V_O > 15.0$ V).
13. Common mode transient immunity in a low state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM}, to assure that the output will remain in a low state (i.e., $V_O < 1.0$ V).
14. This load condition approximates the gate load of a 1200V/75A IGBT.
15. Pulse Width Distortion (PWD) is defined as $|t_{PHL}-t_{PLH}|$ for any given device.

Applications Information

Eliminating Negative IGBT Gate Drive

To keep the IGBT firmly off, the HCPL-3120 has a very low maximum V_{OL} specification of 0.5 V. The HCPL-3120 realizes this very low V_{OL} by using a DMOS transistor with 1 Ω (typical) on resistance in its pull down circuit. When the HCPL-3120 is in the low state, the IGBT gate is shorted to the emitter by Rg + 1 Ω. Minimizing Rg and the lead inductance from the HCPL-3120 to the IGBT gate and emitter (possibly by mounting the HCPL-3120 on a small PC board directly above the IGBT) can eliminate the need for negative IGBT gate drive in many applications as shown in Figure 25. Care should be taken with such a PC board design to avoid routing the IGBT collector or emitter traces close to the HCPL-3120 input as this can result in unwanted coupling of transient signals into the HCPL-3120 and degrade performance. (If the IGBT drain must be routed near the HCPL-3120 input, then the LED should be reverse-biased when in the off state, to prevent the transient signals coupled from the IGBT drain from turning on the HCPL-3120.)

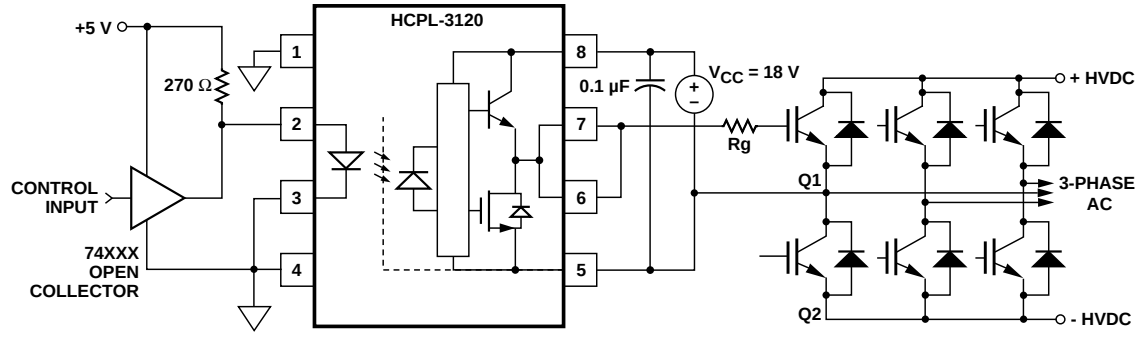

Figure 25. Recommended LED Drive and Application Circuit.

Selecting the Gate Resistor (Rg) to Minimize IGBT Switching Losses.

Step 1: Calculate Rg Minimum from the I_{OL} Peak Specification. The IGBT and Rg in Figure 26 can be analyzed as a simple RC circuit with a voltage supplied by the HCPL-3120.

$$Rg \geq \frac{(V_{CC} - V_{EE} - V_{OL})}{I_{OLPEAK}}$$

$$= \frac{(V_{CC} - V_{EE} - 2\ V)}{I_{OLPEAK}}$$

$$= \frac{(15\ V + 5\ V - 2\ V)}{2.5\ A}$$

$$= 7.2\ \Omega \cong 8\ \Omega$$

The V_{OL} value of 2 V in the previous equation is a conservative value of V_{OL} at the peak current of 2.5A (see Figure 6). At lower Rg values the voltage supplied by the HCPL-3120 is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used V_{EE} in the previous equation is equal to zero volts.

Step 2: Check the HCPL-3120 Power Dissipation and Increase Rg if Necessary. The HCPL-3120 total power dissipation (P_T) is equal to the sum of the emitter power (P_E) and the output power (P_O):

$$P_T = P_E + P_O$$

$$P_E = I_F \cdot V_F \cdot Duty\ Cycle$$

$$P_O = P_{O(BIAS)} + P_{O\ (SWITCHING)}$$

$$= I_{CC} \cdot (V_{CC} - V_{EE}) + E_{SW}(R_G, Q_G) \cdot f$$

For the circuit in Figure 26 with I_F (worst case) = 16 mA, Rg = 8 Ω, Max Duty Cycle = 80%, Qg = 500 nC, f = 20 kHz and T_A max = 85C:

$$P_E = 16\ mA \cdot 1.8\ V \cdot 0.8 = 23\ mW$$

$$P_O = 4.25\ mA \cdot 20\ V + 5.2\ \mu J \cdot 20\ kHz$$

$$= 85\ mW + 104\ mW$$

$$= 189\ mW$$

$$> 178\ mW\ (P_{O(MAX)} @\ 85C$$

$$= 250\ mW - 15C * 4.8\ mW/C)$$

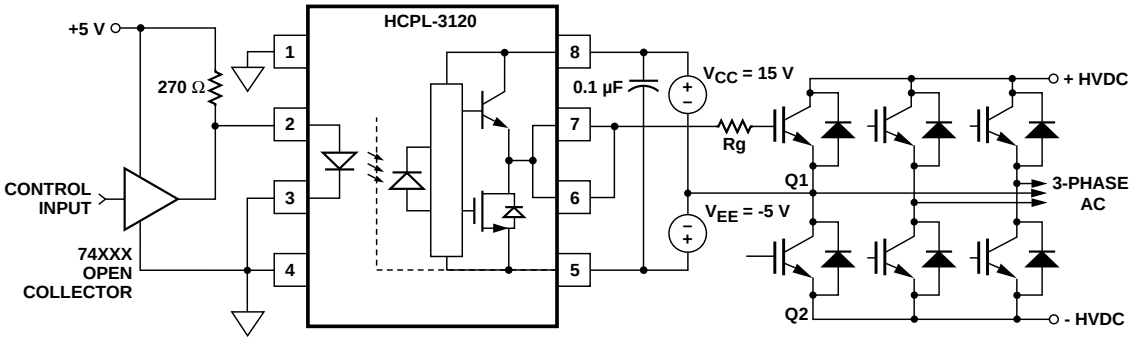

Figure 26. HCPL-3120 Typical Application Circuit with Negative IGBT Gate Drive.

P_E Parameter	Description
I_F	LED Current
V_F	LED On Voltage
Duty Cycle	Maximum LED Duty Cycle

P_O Parameter	Description
I_{CC}	Supply Current
V_{CC}	Positive Supply Voltage
V_{EE}	Negative Supply Voltage
E_{SW}(Rg,Qg)	Energy Dissipated in the HCPL-3120 for each IGBT Switching Cycle (See Figure 27)
f	Switching Frequency

The value of 4.25 mA for I_{CC} in the previous equation was obtained by derating the I_{CC} max of 5 mA (which occurs at -40°C) to I_{CC} max at 85C (see Figure 7).

Since P_O for this case is greater than $P_{O(MAX)}$, Rg must be increased to reduce the HCPL-3120 power dissipation.

$$P_{O(SWITCHING\ MAX)} = P_{O(MAX)} - P_{O(BIAS)} = 178\ mW - 85\ mW = 93\ mW$$

$$E_{SW(MAX)} = \frac{P_{O(SWITCHINGMAX)}}{f} = \frac{93\ mW}{20\ kHz} = 4.65\ \mu W$$

For Qg = 500 nC, from Figure 27, a value of E_{SW} = 4.65 µW gives a Rg = 10.3 Ω.

Thermal Model

The steady state thermal model for the HCPL-3120 is shown in Figure 28. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. As shown by the model, all heat generated flows through θ_{CA} which raises the case temperature T_C accordingly. The value of θ_{CA} depends on the conditions of the board design and is, therefore, determined by the designer. The value of θ_{CA} = 83°C/W was obtained from thermal measurements using a 2.5 x 2.5 inch PC board, with small traces (no ground plane), a single HCPL-3120 soldered into the center of the board and still air. The absolute maximum power dissipation derating specifications assume a θ_{CA}value of 83°C/W.

From the thermal mode in Figure 28 the LED and detector IC junction temperatures can be expressed as:

$$T_{JE} = P_E \cdot (\theta_{LC} || (\theta_{LD} + \theta_{DC}) + \theta_{CA}) + P_D \cdot \left(\frac{\theta_{LC} * \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right) + T_A$$

$$T_{JD} = P_E \left(\frac{\theta_{LC} \cdot \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right) + P_D \cdot (\theta_{DC} || (\theta_{LD} + \theta_{LC}) + \theta_{CA}) + T_A$$

Inserting the values for θ_{LC} and θ_{DC} shown in Figure 28 gives:

$$T_{JE} = P_E \cdot (256°C/W + \theta_{CA}) + P_D \cdot (57°C/W + \theta_{CA}) + T_A$$
$$T_{JD} = P_E \cdot (57°C/W + \theta_{CA}) + P_D \cdot (111°C/W + \theta_{CA}) + T_A$$

For example, given P_E = 45 mW, P_O = 250 mW, T_A = 70°C and θ_{CA} = 83°C/W:

$$T_{JE} = P_E \cdot 339°C/W + P_D \cdot 140°C/W + T_A = 45\ mW \cdot 339°C/W + 250\ mW \cdot 140°C/W + 70°C = 120°C$$

$$T_{JD} = P_E \cdot 140°C/W + P_D \cdot 194°C/W + T_A = 45\ mW \cdot 140C/W + 250\ mW \cdot 194°C/W + 70°C = 125°C$$

T_{JE} and T_{JD} should be limited to 125C based on the board layout and part placement (θ_{CA}) specific to the application.

LED Drive Circuit Considerations for Ultra High CMR Performance.

Without a detector shield, the dominant cause of optocoupler CMR failure is capacitive coupling from the input side of the optocoupler, through the package, to the detector IC as shown in Figure 29. The HCPL-3120 improves CMR performance by using a detector IC with an optically transparent Faraday shield, which diverts the capacitively coupled current away from the sensitive IC circuitry. However, this shield does not eliminate the capacitive coupling between the LED and optocoupler pins 5-8 as shown in Figure 30. This capacitive coupling causes perturbations in the LED current during common mode transients and becomes the major source of CMR failures for a shielded optocoupler. The main design objective of a high CMR LED drive circuit becomes keeping the LED in the proper state (on or off) during common mode transients. For example, the recommended application circuit (Figure 25), can achieve 15 kV/µs CMR while minimizing component complexity.

Techniques to keep the LED in the proper state are discussed in the next two sections.

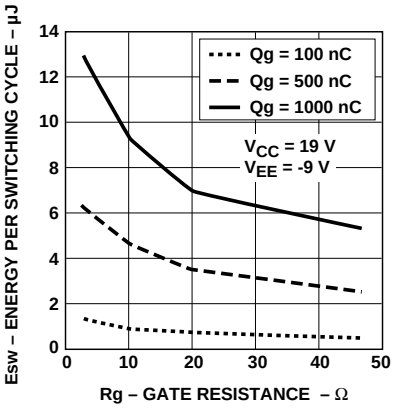

Figure 27. Energy Dissipated in the HCPL-3120 for Each IGBT Switching Cycle.

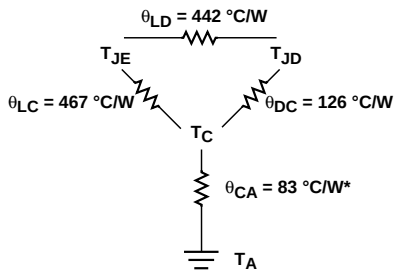

T_{JE} = LED junction temperature
T_{JD} = detector IC junction temperature
T_C = case temperature measured at the center of the package bottom
θ_{LC} = LED-to-case thermal resistance
θ_{LD} = LED-to-detector thermal resistance
θ_{DC} = detector-to-case thermal resistance
θ_{CA} = case-to-ambient thermal resistance
*θ_{CA} will depend on the board design and the placement of the part.

Figure 28. Thermal Model.

CMR with the LED On (CMR_H).

A high CMR LED drive circuit must keep the LED on during common mode transients. This is achieved by overdriving the LED current beyond the input threshold so that it is not pulled below the threshold during a transient. A minimum LED current of 10 mA provides adequate margin over the maximum I_{FLH} of 5 mA to achieve 15 kV/μs CMR.

CMR with the LED Off (CMR_L).

A high CMR LED drive circuit must keep the LED off ($V_F \leq V_{F(OFF)}$) during common mode transients. For example, during a $-dV_{cm}/dt$ transient in Figure 31, the current flowing through C_{LEDP} also flows through the R_{SAT} and V_{SAT} of the logic gate. As long as the low state voltage developed across the logic gate is less than $V_{F(OFF)}$, the LED will remain off and no common mode failure will occur.

The open collector drive circuit, shown in Figure 32, cannot keep the LED off during a +dVcm/dt transient, since all the current flowing through C_{LEDN} must be supplied by the LED, and it is not recommended for applications requiring ultra high CMR_L performance. Figure 33 is an alternative drive circuit which, like the recommended application circuit (Figure 25), does achieve ultra high CMR performance by shunting the LED in the off state.

Under Voltage Lockout Feature.

The HCPL-3120 contains an under voltage lockout (UVLO) feature that is designed to protect the IGBT under fault conditions which cause the HCPL-3120 supply voltage (equivalent to the fully-charged IGBT gate voltage) to drop below a level necessary to keep the IGBT in a low resistance state. When the HCPL-3120 output is in the high state and the supply voltage drops below the HCPL-3120 V_{UVLO-} threshold ($9.5 < V_{UVLO-} < 12.0$) the optocoupler output will go into the low state with a typical delay, UVLO Turn Off Delay, of 0.6 μs.

When the HCPL-3120 output is in the low state and the supply voltage rises above the HCPL-3120 V_{UVLO+} threshold ($11.0 < V_{UVLO+} < 13.5$) the optocoupler output will go into the high state (assumes LED is “ON”) with a typical delay, UVLO Turn On Delay of 0.8 μs.

IPM Dead Time and Propagation Delay Specifications.

The HCPL-3120 includes a Propagation Delay Difference (PDD) specification intended to help designers minimize “dead time” in their power inverter designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 25) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices between the high and low voltage motor rails.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 34. The amount of delay necessary to achieve this conditions is equal to the maximum value of the propagation delay difference specification, PDD_{MAX}, which is specified to be 350 ns over the operating temperature range of -40°C to 100°C.

Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the

maximum and minimum propagation delay difference specifications as shown in Figure 35. The maximum dead time for the HCPL-3120 is 700 ns (= 350 ns - (-350 ns)) over an operating temperature range of -40°C to 100°C.

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical IGBTs.
