**Linear LED Driver**

## General Description

The AF1880 is a linear LED driver. The application of high bright LED is widely used for general illumination.

The AF1880 maximum output current is 50mA. Typical variations is  $\pm 2\%$  in  $V_{IN} = 6 \sim 500V$  input voltage range and  $-40 \sim 85^\circ C$  temperature range. Ground current is approximately  $32\mu A$ , from zero to maximum loading conditions at  $T_A=25^\circ C$ .

Built-in thermal shutdown protection against any fault conditions. The output current can be setting by place a resistor at  $V_{CS}$  pin. For ease of application, the AF1880 comes in the popular 3-pin SOT-223.

### Absolute Maximum Ratings ( $T_A=25^\circ\text{C}$ Unless otherwise noted)

The following ratings designate persistent limits beyond which damage to the device may occur.

Symbol	Parameter	Value	Unit
$V_{IN}^{(1)}$	$V_{DD}$ Pin Voltage	$V_{SS} - 0.3$ to $V_{SS} + 500$	V
$V_{CS}$	Vout Pin Voltage	$V_{SS} - 0.3$ to 6	V
$P_D$	Power Dissipation	2.8 40 55	W
$R_{\theta_{JC}}$	Junction to Case Thermal Resistance	15 12 10	$^\circ\text{C}/\text{W}$
$R_{\theta_{JA}}$	Junction to Ambient Thermal Resistance	165 112 100	$^\circ\text{C}/\text{W}$
$T_{OPR}$	Operating Temperature Range	-20 to +85	$^\circ\text{C}$
$T_{STG}$	Storage Temperature Range	-40 to +150	$^\circ\text{C}$

#### Caution:

The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

## Function Description

### Current setting

Current setting by place a resistor between  $V_{CS}$  pin and GND, the current as follow:

$$I_{LED} = I_{GND} + \frac{V_{CS}}{R_{CS}} = 32\mu + \frac{0.25}{R_{CS}}$$

### Thermal Considerations

The AF1880 is designed to provide maximum 50mA of continuous current. Maximum power dissipation can be calculated based on the output current and the voltage drop across the part.

The maximum dissipation the package can handle is given by:

$$P_D = \left( \frac{T_{J(MAX)} - T_A}{R_{\theta(JA)}} \right)$$

The actual power dissipation of the circuit can be determined using the equation:

$$P_D = (V_{IN} - V_{LED})(I_{GND} + I_{LED})$$

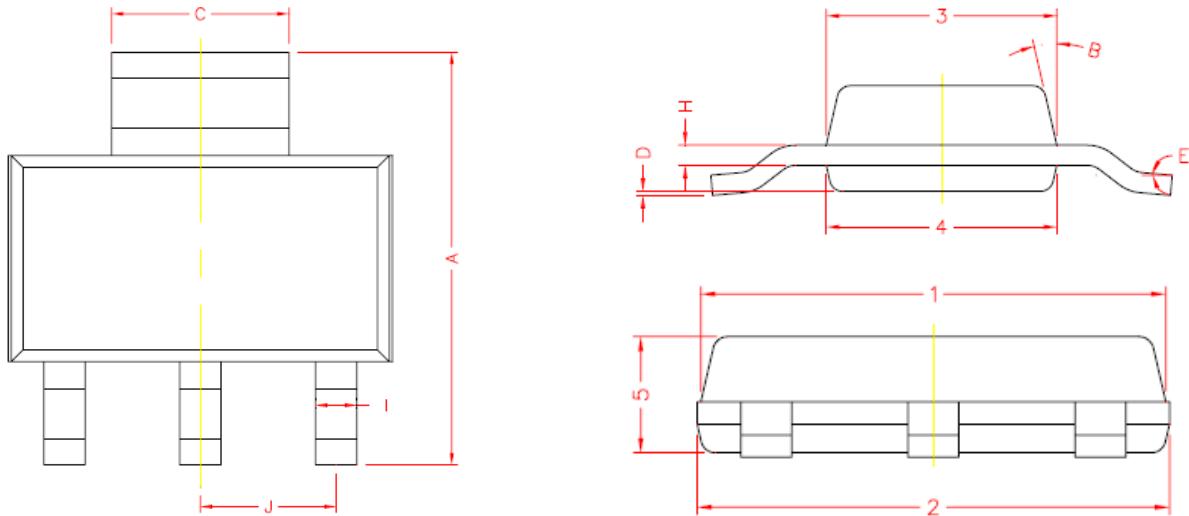

Substituting  $P_{D(MAX)}$  for  $P_D$  and solving for the operating conditions that are critical to the application will give the maximum operating conditions for the circuit.
