# ST-NXP Wireless

## IMPORTANT NOTICE

Dear customer,

As from August 2<sup>nd</sup> 2008, the wireless operations of NXP have moved to a new company, ST-NXP Wireless.

As a result, the following changes are applicable to the attached document.

- **Company name - Philips Semiconductors** is replaced with **ST-NXP Wireless**.
- **Copyright** - the copyright notice at the bottom of each page “© Koninklijke Philips Electronics N.V. 200x. All rights reserved”, shall now read: “© ST-NXP Wireless 200x - All rights reserved”.
- **Web site** - <http://www.semiconductors.philips.com> is replaced with <http://www.stnwireless.com>
- **Contact information** - the list of sales offices previously obtained by sending an email to [sales.addresses@www.semiconductors.philips.com](mailto:sales.addresses@www.semiconductors.philips.com), is now found at <http://www.stnwireless.com> under Contacts.

If you have any questions related to the document, please contact our nearest sales office. Thank you for your cooperation and understanding.

ST-NXP Wireless

# PDIUSB12

Universal Serial Bus peripheral controller with parallel bus

Rev. 09 — 11 May 2006

Product data sheet

## 1. General description

---

The PDIUSB12 is a cost- and feature-optimized USB peripheral controller. It is normally used in microcontroller-based systems and communicates with the system microcontroller over the high-speed general-purpose parallel interface. It also supports local DMA transfer.

This modular approach to implementing a USB interface allows the designer to choose the optimum system microcontroller from the wide variety available. This flexibility cuts down development time, risks and costs, by allowing the use of the existing architecture, minimizing firmware investments. This results in the fastest way to develop the most cost-effective USB peripheral solution.

The PDIUSB12 fully conforms to *Universal Serial Bus Specification Rev. 2.0*, supporting data transfer at full-speed (12 Mbit/s). It is also designed to be compliant with most device class specifications: imaging class, mass storage devices, communication devices, printing devices and human interface devices. The PDIUSB12 is ideally suited for many peripherals, such as printer, scanner, external mass storage (Zip drive) and digital still camera. It offers an immediate cost reduction for applications that currently use SCSI implementations.

The PDIUSB12 low suspend power consumption along with the LazyClock output allows for easy implementation of equipment that is compliant to the ACPI, OnNow and USB power management requirements. The low operating power allows the implementation of bus powered peripherals.

It also incorporates features, such as SoftConnect, GoodLink, programmable clock output, low frequency crystal oscillator, and integration of termination resistors. All of these features contribute to significant cost savings in the system implementation and at the same time ease the implementation of advanced USB functionality into peripherals.

## 2. Features

---

- Complies with *Universal Serial Bus specification Rev. 2.0*
- Supports data transfer at full-speed (12 Mbit/s)
- High performance USB peripheral controller with integrated SIE, FIFO memory, transceiver and voltage regulator
- Compliant with most device class specifications
- High-speed (2 MB/s) parallel interface to any external microcontroller or microprocessor
- Fully autonomous DMA operation
- Integrated 320 B of multi-configuration FIFO memory

**PHILIPS**

- Double buffering scheme for main endpoint increases throughput and eases real-time data transfer
- Data transfer rates: 1 MB/s achievable in bulk mode, 1 Mbit/s achievable in isochronous mode
- Bus-powered capability with very good EMI performance
- Controllable LazyClock output during suspend
- Software-controllable connection to the USB bus (SoftConnect)
- Good USB connection indicator that blinks with traffic (GoodLink)
- Programmable clock frequency output
- Complies with the ACPI, OnNow and USB power management requirements
- Internal Power-On Reset (POR) and low-voltage reset circuit
- Available in SO28 and TSSOP28 pin packages
- Full industrial grade operation from  $-40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$
- Full-scan design with high fault coverage ( $> 99\%$ ) ensures high quality
- Operation with dual voltages:  $3.3\text{ V} \pm 0.3\text{ V}$  or extended 5 V supply range of 4.0 V to 5.5 V
- Multiple interrupt modes to facilitate both bulk and isochronous transfers

### 3. Ordering information

Table 1. Ordering information

Outside North America	North America	Package		Temperature range	Version
		Name	Description		
PDIUSB12D	PDIUSB12D	SO28	plastic small outline package; 28 leads; body width 7.5 mm	$-40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$	SOT136-1
PDIUSB12PW	PDIUSB12PW DH	TSSOP28	plastic thin shrink small outline package; 28 leads; body width 4.4 mm	$-40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$	SOT361-1

## 4. Block diagram

## 5. Pinning information

### 5.1 Pinning

## 5.2 Pin description

Table 2. Pin description

Symbol	Pin	Type <sup>[1]</sup>	Description
DATA0	1	IO2	bit 0 of bidirectional data; slew-rate controlled
DATA1	2	IO2	bit 1 of bidirectional data; slew-rate controlled
DATA2	3	IO2	bit 2 of bidirectional data; slew-rate controlled
DATA3	4	IO2	bit 3 of bidirectional data; slew-rate controlled
GND	5	P	ground
DATA4	6	IO2	bit 4 of bidirectional data; slew-rate controlled
DATA5	7	IO2	bit 5 of bidirectional data; slew-rate controlled
DATA6	8	IO2	bit 6 of bidirectional data; slew-rate controlled
DATA7	9	IO2	bit 7 of bidirectional data; slew-rate controlled
ALE	10	I	Address Latch Enable: The falling edge is used to close the latch of the address information in a multiplexed address or data bus. Permanently tied to LOW for separate address or data bus configuration.
CS_N	11	I	chip select (active LOW) When the CS_N pin is LOW, ensure that the RESET_N pin is in inactive state; otherwise, the device will enter test mode.
SUSPEND	12	I, OD4	device is in the suspend state
CLKOUT	13	O2	programmable output clock (slew-rate controlled)
INT_N	14	OD4	interrupt (active LOW)
RD_N	15	I	read strobe (active LOW)
WR_N	16	I	write strobe (active LOW).
DMREQ	17	O4	DMA request
DMACK_N	18	I	DMA acknowledge (active LOW)
EOT_N	19	I	end of DMA transfer (active LOW); double up as $V_{BUS}$ sensing. EOT_N is only valid when asserted together with DMACK_N and either RD_N or WR_N.
RESET_N	20	I	reset (active LOW and asynchronous); built-in power-on reset circuit is present on-chip, so the pin can be tied HIGH to $V_{CC}$ When the RESET_N pin is LOW, ensure that the CS_N pin is in inactive state; otherwise, the device will enter test mode.
GL_N	21	OD8	GoodLink LED indicator (active LOW)
XTAL1	22	I	crystal connection 1 (6 MHz)
XTAL2	23	O	crystal connection 2 (6 MHz); if the external clock signal, instead of the crystal, is connected to XTAL1, then XTAL2 should be floated
$V_{CC}$	24	P	voltage supply (4.0 V to 5.5 V) To operate the IC at 3.3 V, supply 3.3 V to both the $V_{CC}$ and VOUT3.3 pins.
D-	25	A	USB D- data line

Table 2. Pin description ...continued

Symbol	Pin	Type <sup>[1]</sup>	Description
D+	26	A	USB D+ data line
VOUT3.3	27	P	3.3 V regulated output; to operate the IC at 3.3 V, supply a 3.3 V to both the V <sub>CC</sub> and VOUT3.3 pins
A0	28	I	address bit <b>A0 = 1</b> — Selects the command instruction <b>A0 = 0</b> — selects the data phase This bit is a don't care in a multiplexed address and data bus configuration and should be tied to HIGH.

[1] P: power or ground; A: analog; I: input; O: Output; O2: Output with 2 mA drive; OD4: Output open-drain with 4 mA drive; OD8: Output open-drain with 8 mA drive; IO2: Input and output with 2 mA drive; O4: Output with 4 mA drive.

## 6. Functional description

### 6.1 Analog transceiver

The integrated transceiver directly interfaces to USB cables through termination resistors.

### 6.2 Voltage regulator

A 3.3 V regulator is integrated on-chip to supply the analog transceiver. This voltage is also provided as an output to connect to the external 1.5 k $\Omega$  pull-up resistor. Alternatively, the PDIUSB12 provides the SoftConnect technology with an integrated 1.5 k $\Omega$  pull-up resistor.

### 6.3 PLL

A 6 MHz-to-48 MHz clock multiplier Phase-Locked Loop (PLL) is integrated on-chip. This allows the use of a low-cost 6 MHz crystal. ElectroMagnetic Interference (EMI) is also minimized because of the lower frequency crystal. No external components are needed for the operation of the PLL.

### 6.4 Bit clock recovery

The bit clock recovery circuit recovers the clock from the incoming USB data stream using 4  $\times$  over-sampling principle. It can track jitter and frequency drift specified by *Universal Serial Bus Specification Rev. 2.0*.

### 6.5 Philips Serial Interface Engine (PSIE)

The Philips SIE implements the full USB protocol layer. It is completely hardwired for speed and needs no firmware intervention. The functions of this block include: synchronization pattern recognition, parallel or serial conversion, bit stuffing or discarding stuffed bits, CRC checking or generation, PID verification or generation, address recognition, and handshake evaluation or generation.

### 6.6 SoftConnect

The connection to the USB is accomplished by connecting D+ (for full-speed USB device) to HIGH through a 1.5 k $\Omega$  pull-up resistor. In the PDIUSB12, the 1.5 k $\Omega$  pull-up resistor is integrated on-chip and is not connected to V<sub>CC</sub> by default. The connection is established through a command sent by the external or system microcontroller. This allows the system microcontroller to complete its initialization sequence before deciding to establish connection to the USB. Re-initialization of the USB bus connection can also be performed without requiring to pull out the cable.

The PDIUSB12 will check for USB V<sub>BUS</sub> availability before the connection can be established. The V<sub>BUS</sub> sensing is provided using pin EOT\_N. For details, see [Section 5.2](#). Sharing of the V<sub>BUS</sub> sensing and EOT\_N can be easily accomplished by using the V<sub>BUS</sub> voltage as the pull-up voltage for the normally open-drain output of the DMA controller pin.

**Remark:** The tolerance of internal resistors is higher (25 %) than that specified in *Universal Serial Bus Specification Rev. 2.0* (5 %). The overall voltage specification for the connection, however, can still be met with good margin. The decision to make sure of this feature lies with users.

## 6.7 GoodLink

A good USB connection indication is provided through the GoodLink technology. During enumeration, the LED indicator will momentarily blink on corresponding to the enumeration traffic. When the PDIUSB12 is successfully enumerated and configured, the LED indicator will be permanently on. Subsequent successful (with acknowledgment) transfer to and from the PDIUSB12 will blink off the LED. During suspend, the LED will be off.

This feature provides a user-friendly indication on the status of the USB device, the connected hub and the USB traffic. It is a useful field diagnostics tool to isolate faulty equipment. This feature helps lower field support and hotline costs.

## 6.8 Memory Management Unit (MMU) and integrated RAM

The difference between MMU and the integrated RAM buffer lies in the speed between USB, running in bursts of 12 Mbit/s and the parallel interface to the microcontroller. This allows the microcontroller to read and write USB packets at its own speed.

## 6.9 Parallel and DMA interface

A generic parallel interface is defined for ease-of-use and speed, and allows direct interfacing to major microcontrollers. To a microcontroller, the PDIUSB12 appears as a memory device with 8-bit data bus and 1-bit address line (occupying two locations). The PDIUSB12 supports both multiplexed and non-multiplexed address and data bus. The PDIUSB12 also supports Direct Memory Access (DMA) transfer that allows the main endpoint (endpoint 2) to directly transfer to and from the local shared memory. Both single-cycle and burst mode DMA transfers are supported.

## 6.10 Example of parallel interface to an 80C51 microcontroller

In the example shown in [Figure 3](#), the ALE pin is permanently tied to LOW to signify a separate address and data bus configuration. The A0 pin of the PDIUSB12 connects to any of the 80C51 I/O ports. This port controls the command or data phase to the PDIUSB12. The multiplexed address and data bus of the 80C51 can now be directly connected to the data bus of the PDIUSB12. The address phase will be ignored by the PDIUSB12. The clock input signal of the 80C51 (pin XTAL1) can be provided by output CLKOUT of the PDIUSB12.

Fig 3. Example of a parallel interface to an 80C51 microcontroller

## 7. Direct Memory Access (DMA) transfer

DMA allows an efficient transfer of a block of data between the host and local shared memory. Using a DMA Controller (DMAC), the data transfer between the main endpoint (endpoint 2) of the PDIUSB12 and the local shared memory can occur autonomously, without the local CPU intervention.

Preceding any DMA transfer, the local CPU receives from the host the necessary setup information and accordingly programs the DMA controller. Typically, the DMA controller is set up for demand transfer mode, and the Byte Count register and the address counter are programmed with the correct values. In this mode, transfers occur only when the PDIUSB12 requests them and are terminated when the Byte Count register reaches zero. After the DMA controller is programmed, the DMA ENABLE bit of the PDIUSB12 is set by the local CPU to initiate the transfer.

The PDIUSB12 can be programmed for single-cycle DMA or burst mode DMA. In single-cycle DMA, the DMREQ pin is deactivated for every single acknowledgment by DMACK\_N before being re-asserted. In burst mode DMA, the DMREQ pin is kept active for the number of bursts programmed in the device before going inactive. This process continues until the PDIUSB12 receives a DMA termination notice through pin EOT\_N. This will generate an interrupt to notify the local CPU that the DMA operation is completed.

For the DMA read operation, the DMREQ pin will only be activated whenever the buffer is full, signaling that the host has successfully transferred a packet to the PDIUSB12. With the double buffering scheme, the host can start filling up the second buffer while the first buffer is being read out. This parallel processing increases the effective throughput. When the host does not completely fill up the buffer (less than 64 B or 128 B for single direction ISO configuration), the DMREQ pin will be deactivated at the last byte of the buffer, regardless of the current DMA burst count. It will be re-asserted on the next packet with a refreshed DMA burst count.

Similarly, for DMA write operations, the DMREQ pin remains active whenever the buffer is not full. When the buffer is filled up, the packet is sent over to the host on the next IN token and DMREQ will be reactivated if the transfer was successful. Also, the double buffering scheme here will improve throughput. For non-isochronous transfer (bulk and interrupt), the buffer needs to be completely filled up by the DMA write operation before data is sent to the host. The only exception is at the end of DMA transfer, when the reception of the EOT\_N pin will stop the DMA write operation and the buffer content will be sent to the host on the next IN token.

For isochronous transfers, the local CPU and DMA controller have to guarantee that they can sink or source the maximum packet size in one USB frame (1 ms).

The assertion of pin DMACK\_N automatically selects the main endpoint (endpoint 2), regardless of the current selected endpoint. The DMA operation of the PDIUSB12 can be interleaved with normal I/O access to other endpoints.

The DMA operation can be terminated by resetting the DMA ENABLE register bit or the assertion of EOT\_N together with DMACK\_N and either RD\_N or WR\_N.

The PDIUSB12 supports DMA transfer in single address mode and it can also work in dual address mode of the DMA controller. In single address mode, the DMA transfer is done using the DREQ, DMACK\_N, EOT\_N, WR\_N and RD\_N control lines. In dual address mode, pins DMREQ, DMACK\_N and EOT\_N are **not** used; instead CS\_N, WR\_N and RD\_N control signals are used. The I/O mode transfer protocol of the PDIUSB12 needs to be followed. The source of the DMAC is accessed during the read cycle and the destination during the write cycle. Transfer needs to be done in two separate bus cycles, temporarily storing data in the DMAC.

## 8. Endpoint description

The PDIUSB12 endpoints are sufficiently generic to be used by various device classes ranging from imaging, printer, mass storage and communication device classes. The PDIUSB12 endpoints can be configured for four operating modes, depending on the Set Mode command. The four modes are:

- Mode 0      Non-isochronous transfer (Non-ISO mode)
- Mode 1      Isochronous output only transfer (ISO-OUT mode)
- Mode 2      Isochronous input only transfer (ISO-IN mode)
- Mode 3      Isochronous input and output transfer (ISO-I/O mode)

Table 3. Endpoint configuration

Endpoint number	Endpoint index	Transfer type	Direction <sup>[1]</sup>	Max. Packet size (bytes)
<b>Mode 0 (Non-ISO mode)</b>				
0	0	control	OUT	16
	1		IN	16
1	2	generic <sup>[2]</sup>	OUT	16
	3		IN	16
2	4	generic <sup>[2][3]</sup>	OUT	64 <sup>[4]</sup>
	5		IN	64 <sup>[4]</sup>
<b>Mode 1 (ISO-OUT mode)</b>				
0	0	control	OUT	16
	1		IN	16
1	2	generic <sup>[2]</sup>	OUT	16
	3		IN	16
2	4	isochronous <sup>[3]</sup>	OUT	128 <sup>[4]</sup>
<b>Mode 2 (ISO-IN mode)</b>				
0	0	control	OUT	16
	1		IN	16
1	2	generic <sup>[2]</sup>	OUT	16
	3		IN	16
2	5	isochronous <sup>[3]</sup>	IN	128 <sup>[4]</sup>
<b>Mode 3 (ISO-I/O mode)</b>				
0	0	control	OUT	16
	1		IN	16
1	2	generic <sup>[2]</sup>	OUT	16
	3		IN	16
2	4	isochronous <sup>[3]</sup>	OUT	64 <sup>[4]</sup>
	5		IN	64 <sup>[4]</sup>

[1] IN: input for the USB host; OUT: output from the USB host.

[2] Generic endpoints can be used either as bulk or interrupt endpoint.

[3] The main endpoint (endpoint number 2) is double-buffered to ease synchronization with real-time applications and to increase throughput. This endpoint supports DMA access.

[4] Denotes double buffering. The size shown is for a single buffer.

## 9. Main endpoint

The main endpoint (endpoint number 2) is the primary endpoint for sinking or sourcing relatively large amounts of data. It implements the following features to ease this task:

- Double buffering. This allows parallel operation between the USB access and the local CPU access, increasing throughput. Buffer switching is automatically handled. This results in transparent buffer operation.
- DMA operation. This can be interleaved with normal I/O operation to other endpoints.
- Automatic pointer handling during the DMA operation. No local CPU intervention is necessary when 'crossing' the buffer boundary.
- Configurable endpoint for either isochronous transfer or non-isochronous (bulk and interrupt) transfer.

## 10. Command summary

Table 4. Command summary

Name	Destination	Code (Hex)	Transaction
<b>Initialization commands</b>			
Set Address/Enable	device	D0	write 1 B
Set Endpoint Enable	device	D8	write 1 B
Set Mode	device	F3	write 2 B
Set DMA	device	FB	write or read 1 B
<b>Data flow commands</b>			
Read Interrupt register	device	F4	read 2 B
Select Endpoint	control OUT	00	read 1 B (optional)
	control IN	01	read 1 B (optional)
	endpoint 1 OUT	02	read 1 B (optional)
	endpoint 1 IN	03	read 1 B (optional)
	endpoint 2 OUT	04	read 1 B (optional)
	endpoint 2 IN	05	read 1 B (optional)
Read Last Transaction Status	control OUT	40	read 1 B
	control IN	41	read 1 B
	endpoint 1 OUT	42	read 1 B
	endpoint 1 IN	43	read 1 B
	endpoint 2 OUT	44	read 1 B
	endpoint 2 IN	45	read 1 B
Read Buffer	selected endpoint	F0	read n B
Write Buffer	selected endpoint	F0	write n B

Table 4. Command summary ...continued

Name	Destination	Code (Hex)	Transaction
Set Endpoint Status	control OUT	40	write 1 B
	control IN	41	write 1 B
	endpoint 1 OUT	42	write 1 B
	endpoint 1 IN	43	write 1 B
	endpoint 2 OUT	44	write 1 B
	endpoint 2 IN	45	write 1 B
	Acknowledge Setup	selected endpoint	F1
Clear Buffer	selected endpoint	F2	none
Validate Buffer	selected endpoint	FA	none
<b>General commands</b>			
Send Resume		F6	none
Read Current Frame Number		F5	read 1 or 2 B

## 11. Command description

### 11.1 Command procedure

There are three basic types of commands: initialization, data flow and general. Respectively, these are used to initialize the function; for data flow between the function and the host; and some general commands.

### 11.2 Initialization commands

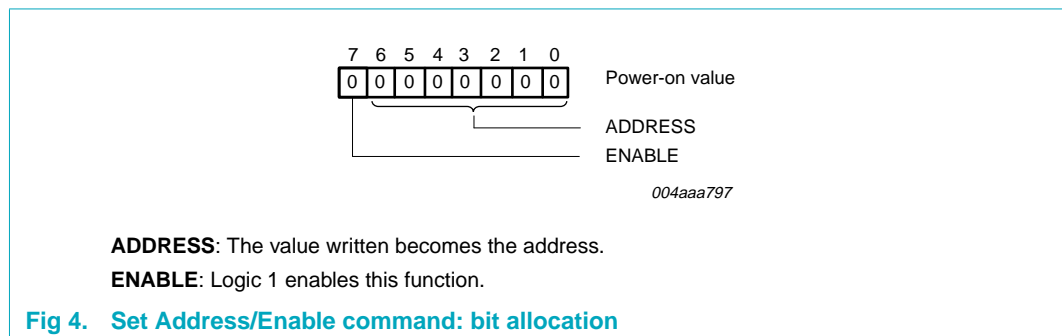

Initialization commands are used during the enumeration process of the USB network. These commands are used to enable function endpoints. They are also used to set the USB assigned address.

#### 11.2.1 Set Address/Enable

**Code (Hex)** — D0

**Transaction** — write 1 B

This command is used to set the USB assigned address and enable the function.

### 11.2.2 Set Endpoint Enable

**Code (Hex)** — D8

**Transaction** — write 1 B

The generic or isochronous endpoints can only be enabled when the function is enabled using the Set Address/Enable command.

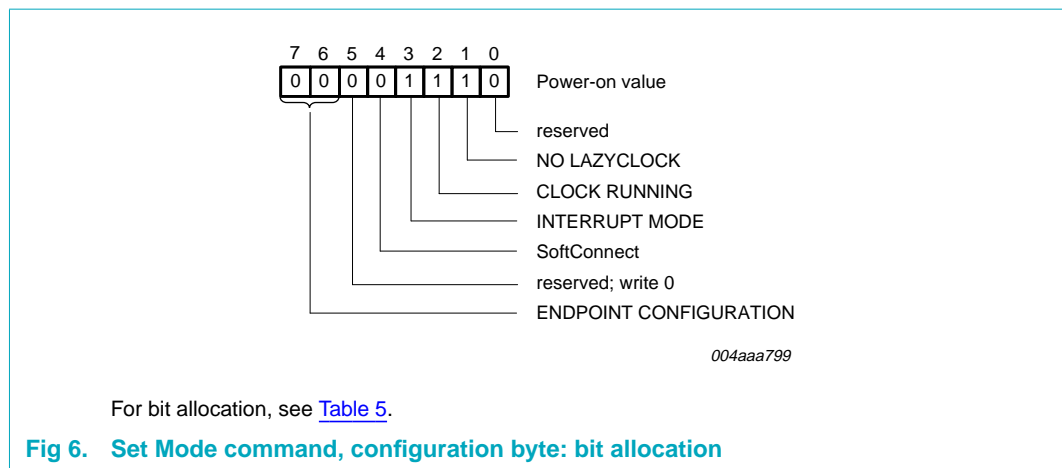

### 11.2.3 Set Mode

**Code (Hex)** — F3

**Transaction** — write 2 B

The Set Mode command is followed by two data writes. The first byte contains configuration bits. The second byte is the clock division factor byte.

**Table 5. Set Mode command, configuration byte: bit allocation**

Bit	Symbol	Description
7 to 6	ENDPOINT CONFIGURATION	These two bits set endpoint configurations as follows: Mode 0 (Non-ISO mode) Mode 1 (ISO-OUT mode) Mode 2 (ISO-IN mode) Mode 3 (ISO-I/O mode) For details, see <a href="#">Section 8</a> .
4	SoftConnect	Logic 1 indicates that the upstream pull-up resistor will be connected if V <sub>BUS</sub> is available. Logic 0 means that the upstream resistor will not be connected. The programmed value will not be changed by a bus reset.
3	INTERRUPT MODE	Logic 1 indicates that all errors and 'NAK' are reported and will generate an interrupt. Logic 0 indicates that only OK is reported. The programmed value will not be changed by a bus reset.
2	CLOCK RUNNING	Logic 1 indicates that internal clocks and PLL are always running even during the suspend state. Logic 0 indicates that the internal clock, crystal oscillator and PLL are stopped, whenever not needed. To meet the strict suspend current requirement, this bit must be set to logic 0. The programmed value will not be changed by a bus reset.
1	NO LAZYCLOCK	Logic 1 indicates that CLKOUT will not switch to LazyClock. Logic 0 indicates that CLKOUT switches to LazyClock 1 ms after the SUSPEND pin goes HIGH. LazyClock frequency is 30 kHz ± 40 %. The programmed value will not be changed by a bus reset.

**Table 6. Set Mode command, clock division factor byte: bit allocation**

Bit	Symbol	Description
7	SOF-ONLY INTERRUPT MODE	Setting this bit to logic 1 will cause the interrupt line to be activated because of the Start-Of-Frame (SOF) clock only, regardless of the setting of PIN-INTERRUPT MODE, bit 5 of Set DMA.
6	SET_TO_ONE	This bit must be set to logic 1 before any DMA read or DMA write operation. This bit should always be set to logic 1 after power. It is zero after power-on reset.
3 to 0	CLOCK DIVISION FACTOR	The value indicates the clock division factor for CLKOUT. The output frequency is 48 MHz / (N + 1), where N is the clock division factor. The reset value is 11. This will produce an output frequency of 4 MHz that can then be programmed up or down by the user. The minimum value is 1, giving a frequency range of 4 MHz to 24 MHz. The minimum value of N is 0, giving a maximum frequency of 48 MHz. The maximum value of N is 11, giving a minimum frequency of 4 MHz. The PDIUSB12 design ensures no glitching during frequency change. The programmed value will not be changed by a bus reset.

**11.2.4 Set DMA**

**Code (Hex) — FB**

**Transaction — read or write 1 B**

The Set DMA command is followed by one data write or read to or from the DMA Configuration register.

**11.2.4.1 DMA Configuration register**

During the DMA operation, the 2 B buffer header (status and byte length information) is not transferred to or from the local CPU. This allows the DMA data to be continuous and not interleaved by chunks of these headers. For DMA read operations, the header will be skipped by the PDIUSB12. See [Section 11.3.5](#) command. For DMA write operations, the header will be automatically added by the PDIUSB12. This provides a clean and simple DMA data transfer.

Table 7. Set DMA command: bit allocation

Bit	Symbol	Description
7	ENDPOINT INDEX 5 INTERRUPT ENABLE	Logic 1 allows an interrupt to be generated whenever the endpoint buffer is validated (see <a href="#">Section 11.3.8</a> command). Normally turned off for the DMA operation to reduce unnecessary CPU servicing.
6	ENDPOINT INDEX 4 INTERRUPT ENABLE	Logic 1 allows an interrupt to be generated whenever the endpoint buffer contains a valid packet. Normally turned off for the DMA operation to reduce unnecessary CPU servicing.
5	INTERRUPT PIN MODE	Logic 0 signifies a normal interrupt pin mode in which an interrupt is generated as a logical OR of all the bits in interrupt registers. Logic 1 signifies that the interrupt will occur when SOF clock is seen on the upstream USB bus. The other normal interrupts are still active.
4	AUTO RELOAD	When this bit is set to logic 1, the DMA operation will automatically restart.
3	DMA DIRECTION	This bit determines the direction of data flow during a DMA transfer. Logic 1 means from the external shared memory to the PDIUSB12 (DMA write); logic 0 means from the PDIUSB12 to the external shared memory (DMA read).
2	DMA ENABLE	Writing logic 1 to this bit will start the DMA operation through the assertion of pin DMREQ. The main endpoint buffer must be full (for DMA read) or empty (for DMA write), before DMREQ is asserted. In single cycle DMA mode, the DMREQ is deactivated on receiving DMACK_N. In burst mode DMA, the DMREQ is deactivated after the number of burst is exhausted. It is then asserted again for the next burst. This process continues until EOT_N is asserted together with DMACK_N and either RD_N or WR_N, which will reset this bit to logic 0 and terminate the DMA operation. The DMA operation can also be terminated by writing logic 0 to this bit.
1 to 0	DMA BURST	Selects the burst length for DMA operation: 00 Single-cycle DMA 01 Burst (4-cycle) DMA 10 Burst (8-cycle) DMA 11 Burst (16-cycle) DMA

### 11.3 Data flow commands

Data flow commands are used to manage the data transmission between USB endpoints and the external microcontroller. Much of the data flow is initiated using an interrupt to the microcontroller. The microcontroller utilizes these commands to access and determine whether endpoint FIFOs have valid data.

#### 11.3.1 Read Interrupt register

**Code (Hex)** — F4

**Transaction** — read 2 B

This command indicates the origin of an interrupt. The endpoint interrupt bits (bits 0 to 5) are cleared by reading the Endpoint Last Transaction Status register through Read Last Transaction Status command. The other bits are cleared after reading Interrupt registers.

**Table 8. Read Interrupt register, byte 1: bit allocation**

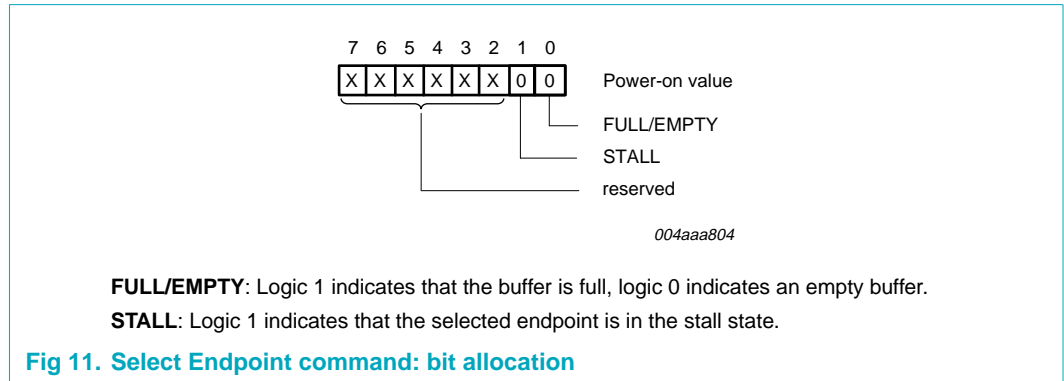

Bit	Symbol	Description
7	SUSPEND CHANGE	When the PDIUSB12 does not receive three SOFs, it will go into the suspend state and the SUSPEND CHANGE bit will be HIGH. Any change to the suspend or awake state will set this bit to HIGH and generate an interrupt.
6	BUS RESET	After a bus reset, an interrupt will be generated and this bit will be logic 1. A bus reset is identical to a hardware reset through the RESET_N pin, except a bus reset generates an interrupt notification and the device is enabled at default address 0.

### 11.3.2 Select Endpoint

**Code (Hex)** — 00 to 05

**Transaction** — read 1 B (optional)

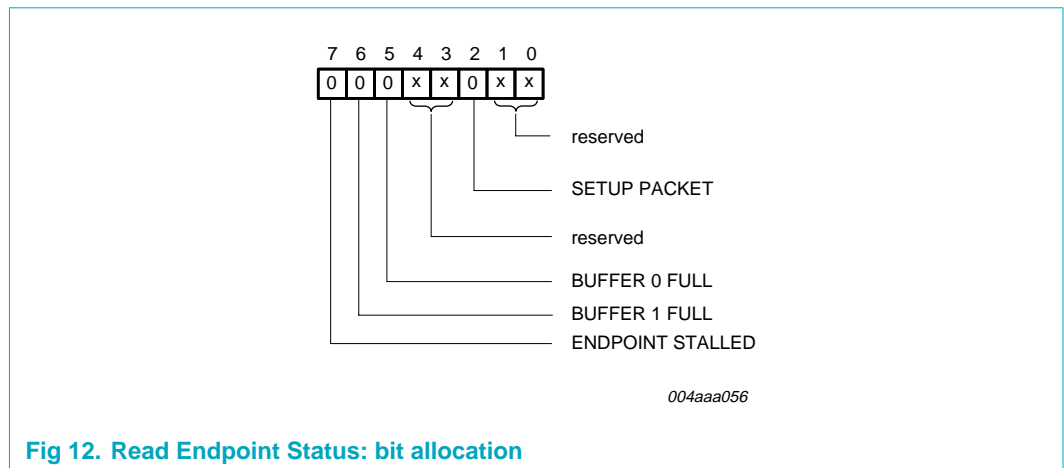

The Select Endpoint command initializes an internal pointer to the start of the selected buffer. Optionally, this command can be followed by a data read, which returns this byte.

### 11.3.3 Read Endpoint Status

**Code (Hex)** — 80 to 85

**Transaction** — read 1 B

### 11.3.4 Read Last Transaction Status register

**Code (Hex)** — 40 to 45

**Transaction** — read 1 B

The Read Last Transaction Status command is followed by one data read that returns the status of the last transaction of the endpoint. This command also resets the corresponding interrupt flag in the Interrupt register, and clears the status, indicating that it was read.

This command is useful for debugging purposes. The status information is overwritten for each new transaction because it keeps track of every transaction.

**Table 9. Read Last Transaction Status register: bit allocation**

Bit	Symbol	Description
7	PREVIOUS STATUS NOT READ	Logic 1 indicates a second event occurred before the previous status was read.
6	DATA0/1 PACKET	Logic 1 indicates the last successful received or sent packet had a DATA1 PID.
5	SETUP PACKET	Logic 1 indicates the last successful received packet had a SETUP token (this will always read 0 for IN buffers).
4 to 1	ERROR CODE	See <a href="#">Table 10</a>
0	DATA RECEIVE/TRANSMIT SUCCESS	Logic 1 indicates that data has been successfully received or transmitted.

**Table 10. Error codes**

Error code (binary)	Description
0000	no error
0001	PID encoding error; bits 7 to 4 are not the inversion of bits 3 to 0
0010	PID unknown; encoding is valid, but PID does not exist
0011	unexpected packet; packet is not of the type expected (= token, data or acknowledge), or SETUP token to a non-control endpoint
0100	token CRC error
0101	data CRC error
0110	time-out error
0111	never happens
1000	unexpected End-Of-Packet (EOP)
1001	sent or received NAK
1010	sent stall, a token was received, but the endpoint was stalled
1011	overflow error, the received packet was longer than the available buffer space
1101	bit stuff error
1111	wrong DATA PID; the received DATA PID was not what was expected

### 11.3.5 Read Buffer

**Code (Hex)** — F0

**Transaction** — read multiple bytes (max. 130)

The Read Buffer command is followed by a number of data reads that return contents of the selected endpoint data buffer. After each read, the internal buffer pointer is incremented by 1.

The buffer pointer is reset to the top of the buffer by the Read Buffer command. This means that reading or writing a buffer can be interrupted by any other command (except for Select Endpoint).

The data in the buffer is organized as follows:

- Byte 0: reserved; can have any value
- Byte 1: number or length of data bytes
- Byte 2: data byte 1
- Byte 3: data byte 2
- and so on

The first two bytes will be skipped in the DMA read operation. Therefore, the first read will get data byte 1, the second read will get data byte 2, and so on. The PDIUSB12 can determine the last byte of this packet through the EOP termination of the USB packet.

### 11.3.6 Write Buffer

**Code (Hex)** — F0

**Transaction** — write multiple bytes (max. 130)

The Write Buffer command is followed by a number of data writes that load the endpoints buffer. Data must be organized in the same way as described in the Read Buffer command. The first byte (reserved) should always be 0.

During the DMA write operation, the first two bytes will be bypassed. Therefore, the first write will write into data byte 1, the second write will write into data byte 2, and so on. For non-isochronous transfer (bulk or interrupt), the buffer must be completely filled before data is sent to the host and a switch to the next buffer occurs. The exception is at the end of the DMA transfer indicated by activation of EOT\_N, when the current buffer content (completely full or not) will be sent to the host.

**Remark:** There is no protection against writing or reading over a buffer's boundary, or against writing into an OUT buffer or reading from an IN buffer. Any of these actions could cause an incorrect operation. Data in an OUT buffer is only meaningful after a successful transaction. The exception is during the DMA operation on the main endpoint (endpoint 2), in which case the pointer is automatically pointed to the second buffer after reaching the boundary (double buffering scheme).

### 11.3.7 Clear Buffer

**Code (Hex)** — F2

**Transaction** — none

When a packet is completely received, an internal endpoint buffer full flag is set. All subsequent packets will be refused by returning a NAK. When the microcontroller has read data, it should free the buffer using the Clear Buffer command. When the buffer is cleared, new packets will be accepted.

**11.3.8 Validate Buffer**

**Code (Hex)** — FA

**Transaction** — none

When the microprocessor has written data into an IN buffer, it should set the buffer full flag using the Validate Buffer command. This indicates that data in the buffer is valid and can be sent to the host when the next IN token is received.

**11.3.9 Set Endpoint Status**

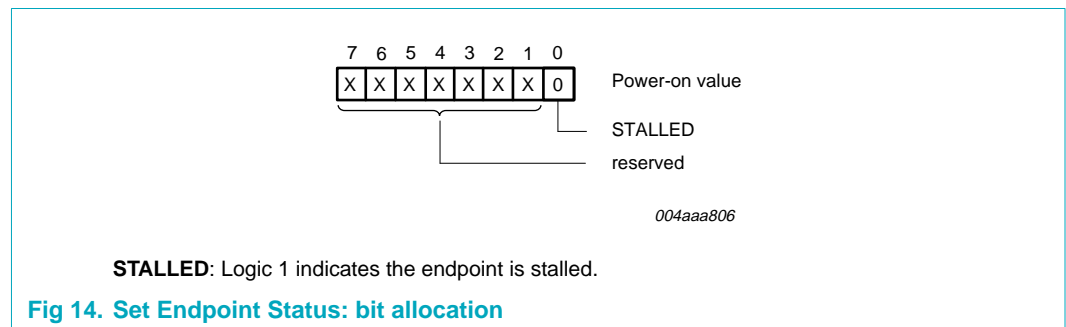

**Code (Hex)** — 40 to 45

**Transaction** — write 1 B

A stalled control endpoint is automatically un-stalled when it receives a SETUP token, regardless of the content of the packet. If the endpoint should stay in its stalled state, the microcontroller can re-stall it.

When a stalled endpoint is un-stalled (either by the Set Endpoint Status command or by receiving a SETUP token), it is also re-initialized. This flushes the buffer and if it is an OUT buffer it waits for a DATA0 PID, if it is an IN buffer it writes a DATA0 PID.

Even when un-stalled, writing logic 0 to Set Endpoint Status initializes the endpoint.

**11.3.10 Acknowledge Setup**

**Code (Hex)** — F1

**Transaction** — none

The arrival of a SETUP packet flushes the IN buffer, and disables the Validate Buffer and Clear Buffer commands for both IN and OUT endpoints.

The microcontroller needs to re-enable these commands using the Acknowledge Setup command. This ensures that the last SETUP packet stays in the buffer and no packet can be sent back to the host, until the microcontroller has acknowledged explicitly that it has seen the SETUP packet.

The microcontroller must send the Acknowledge Setup command to both the IN and OUT endpoints.

### 11.4 General commands

#### 11.4.1 Send Resume

**Code (Hex)** — F6

**Transaction** — none

Sends an upstream resume signal for 10 ms. This command is normally issued when the device is in suspend. The Resume command is not followed by a data read or write.

#### 11.4.2 Read Current Frame Number

**Code (Hex)** — F5

**Transaction** — read 1 or 2 B

This command is followed by one or two data reads and returns the frame number of the last successfully received SOF. The frame number is returned least significant byte first.

Fig 15. Read Current Frame Number

## 12. Interrupt modes

Table 11. Interrupt modes

SOF-ONLY INTERRUPT MODE <sup>[1]</sup>	INTERRUPT PIN MODE <sup>[2]</sup>	Interrupt types
0	0	Normal <sup>[3]</sup>
0	1	Normal + SOF <sup>[3]</sup>
1	X	SOF only

[1] Bit 7 of the clock division factor byte of the Set Mode command (see Table 6).

[2] Bit 5 of the Set DMA command (see Table 7).

[3] Normal interrupts from the Interrupt register.

## 13. Limiting values

**Table 12. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{CC}$	supply voltage		-0.5	+6.0	V
$V_I$	input voltage		-0.5	$V_{CC} + 0.5$ V	V
$I_{lu}$	latch-up current	$V_I < 0$ V or $V_I > V_{CC}$	-	100	mA
$V_{esd}$	electrostatic discharge voltage	$I_{LI} < 1$ $\mu$ A	[1] -2000	+2000	V
$T_{stg}$	storage temperature		-60	+150	$^{\circ}$ C
$P_{tot}$	total power dissipation	$V_{CC} = 5.5$ V	-	95	mW

[1] Equivalent to discharging a 100 pF capacitor through a 1.5 k $\Omega$  resistor.

## 14. Recommended operating conditions

**Table 13. Recommended operating conditions**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{CC1}$	supply voltage 1	apply $V_{CC1}$ to $V_{CC}$ pin only	[1] 4.0	-	5.5	V
$V_{CC2}$	supply voltage 2	apply $V_{CC2}$ to both the $V_{CC}$ and $V_{OUT3.3}$ pins	[2] 3.0	-	3.6	V
$V_I$	input voltage		0	-	5.5	V
$V_{I/O}$	voltage on an input/output pin		0	-	5.5	V
$V_{IA(I/O)}$	input voltage on analog I/O pins		0	-	3.6	V
$V_O$	output voltage		0	-	$V_{CC}$	V
$T_{amb}$	ambient temperature	see <a href="#">Section 15</a> and <a href="#">Section 16</a> per device	[3] -40	-	+85	$^{\circ}$ C

[1] Supply voltage (main mode).

[2] Supply voltage (alternate mode).

[3] Operating ambient temperature in free air.

## 15. Static characteristics

**Table 14. Static characteristics (digital pins)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Input levels</b>						
$V_{IL}$	LOW-level input voltage		-	-	0.8	V
$V_{IH}$	HIGH-level input voltage		2.0	-	-	V
$V_{hys}$	hysteresis voltage	Schmitt trigger pins	0.4	-	0.7	V
<b>Output levels</b>						
$V_{OL}$	LOW-level output voltage	$I_{OL} = \text{rated drive}$	-	-	0.4	V
		$I_{OL} = 20$ $\mu$ A	-	-	0.1	V

Table 14. Static characteristics (digital pins) ...continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>OH</sub>	HIGH-level output voltage	I <sub>OH</sub> = rated drive	2.4	-	-	V
		I <sub>OH</sub> = 20 μA	V <sub>CC</sub> - 0.1 V	-	-	V
<b>Leakage current</b>						
I <sub>OZ</sub>	off-state output current	open-drain pins	-5	-	+5	μA
I <sub>L</sub>	leakage current		-5	-	+5	μA
I <sub>S</sub>	suspend current	oscillator stopped and inputs to GND/V <sub>CC</sub>	-	-	15	μA
I <sub>CC</sub>	supply current		-	15		mA

Table 15. Static characteristics (A/I/O pins)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Leakage current</b>						
I <sub>L(dI)</sub>	data line leakage current	hi-Z; 0 V < V <sub>IN</sub> < 3.3 V	-10	-	+10	μA
<b>Input levels</b>						
V <sub>DI</sub>	differential input sensitivity	(D+) - (D-)	0.2	-	-	V
V <sub>CM</sub>	differential common mode range	includes V <sub>DI</sub> range	0.8	-	2.5	V
V <sub>SE</sub>	single-ended receiver threshold		0.8	-	2.0	V
<b>Output levels</b>						
V <sub>OL</sub>	LOW-level output voltage	R <sub>L</sub> of 1.5 kΩ to 3.6 V	-	-	0.3	V
V <sub>OH</sub>	HIGH-level output voltage	R <sub>L</sub> of 15 kΩ to GND	2.8	-	3.6	V
<b>Capacitance</b>						
C <sub>in</sub>	input capacitance	pin to GND	-	-	20	pF
<b>Output resistance</b>						
Z <sub>DRV</sub>	driver output impedance	steady state drive	[1] 29	-	44	Ω
<b>Pull-up resistance</b>						
Z <sub>PU</sub>	pull-up resistance	SoftConnect = on	1.1	-	1.9	kΩ

[1] Includes external resistors of 18 Ω ± 1 % on D+ and D-.

## 16. Dynamic characteristics

Table 16. Dynamic characteristics (A/I/O pins; full-speed)

C<sub>L</sub> = 50 pF; R<sub>PU</sub> = 1.5 kΩ on D+ to V<sub>CC</sub>; unless otherwise specified.[1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Driver characteristics</b>						
t <sub>R</sub>	rise time	10 % to 90 %	4	-	20	ns
t <sub>F</sub>	fall time	10 % to 90 %	4	-	20	ns
t <sub>RFM</sub>	rise time/fall time matching (t <sub>R</sub> /t <sub>F</sub> )		90	-	110	%
V <sub>CRS</sub>	output signal crossover voltage		1.3	-	2.0	V
<b>Driver timing</b>						
t <sub>EOP</sub>	source EOP width	see <a href="#">Figure 16</a>	160	-	175	ns
t <sub>DEOP</sub>	differential data to EOP transition skew	see <a href="#">Figure 16</a>	-2	-	+5	ns

**Table 16. Dynamic characteristics (A/I/O pins; full-speed) ...continued**  
 $C_L = 50\text{ pF}$ ;  $R_{PU} = 1.5\text{ k}\Omega$  on D+ to  $V_{CC}$ ; unless otherwise specified.<sup>[1]</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Receiver timing:</b>						
$t_{JR1}$	receiver data jitter tolerance to next transition		-18.5	-	+18.5	ns
$t_{JR2}$	receiver data jitter tolerance for paired transition		-9	-	+9	ns
$t_{EOPR1}$	EOP width at receiver	must reject as EOP; see <a href="#">Figure 16</a>	[2] 40	-	-	ns
$t_{EOPR2}$	EOP width at receiver	must accept as EOP; see <a href="#">Figure 16</a>	[2] 82	-	-	ns

- [1] Test circuit, see [Figure 22](#).
- [2] Characterized but not implemented as production test. Guaranteed by design.

**Table 17. Dynamic characteristics (parallel interface)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>ALE timing</b>						
$t_{LH}$	ALE HIGH pulse width		20	-	-	ns
$t_{AVLL}$	address valid to ALE LOW time		10	-	-	ns
$t_{LLAX}$	ALE LOW to address transition time		-	-	10	ns
<b>Write timing</b>						
$t_{CLWL}$	CS_N (DMACK_N) LOW to WR_N LOW time		0 <sup>[1]</sup>	-	-	ns
$t_{WHCH}$	WR_N HIGH to CS_N (DMACK_N) HIGH time		5	-	-	ns
$t_{AVWL}$	A0 valid to WR_N LOW time		0 <sup>[1]</sup>	-	-	ns
			130 <sup>[2]</sup>	-	-	ns
$t_{WHAX}$	WR_N HIGH to A0 transition time		5	-	-	ns
$t_{WL}$	WR_N LOW pulse width		20	-	-	ns
$t_{WDSU}$	write data setup time		30	-	-	ns
$t_{WDH}$	write data hold time		10	-	-	ns
$t_{WC}$	write cycle time		500 <sup>[3]</sup>	-	-	ns

Table 17. Dynamic characteristics (parallel interface) ...continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{(WC - WD)}$	write command to write data		600	-	-	ns
<b>Read timing</b>						
$t_{CLRL}$	CS_N (DMACK_N) LOW to RD_N LOW time		0 [1]	-	-	ns
			130 [2]	-	-	ns
$t_{RHCH}$	RD_N HIGH to CS_N (DMACK_N) HIGH time		5	-	-	ns
$t_{AVRL}$	A0 valid to RD_N LOW time		0 [1]	-	-	ns
$t_{RL}$	RD_N LOW pulse width		20	-	-	ns
$t_{RLDD}$	RD_N LOW to data driven time		-	-	20	ns
$t_{RHDZ}$	RD_N HIGH to data Hi-Z time		-	-	20	ns
$t_{RC}$	read cycle time		500 [3]	-	-	ns
$t_{(WC - RD)}$	write command to read data		600	-	-	ns

[1] Can be negative.

[2] For the DMA access only on the module 64<sup>th</sup> byte and the second last (EOT - 1) byte.

[3] The  $t_{WC}$  and  $t_{RC}$  timing are valid for back-to-back data access only.

Fig 17. ALE timing

Fig 18. Parallel interface timing (I/O and DMA)

Table 18. Dynamic characteristics (DMA)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Single-cycle DMA timing</b>						
$t_{AHRH}$	DMACK_N HIGH to DMREQ HIGH time		-	-	330	ns
$t_{SHAH}$	RD_N/WR_N HIGH to DMACK_N HIGH time		130	-	-	ns
$t_{RHSH}$	DMREQ HIGH to RD_N/WR_N HIGH time		120	-	-	ns
$t_{EL}$	EOT_N LOW pulse width	simultaneous DMACK_N, RD_N/WR_N and EOT_N LOW time	10	-	-	ns
<b>Burst DMA timing</b>						
$t_{SLRL}$	RD_N/WR_N LOW to DMREQ LOW time		-	-	40	ns
$t_{RHNDV}$	RD_N (only) HIGH to next data valid		-	-	420	ns
<b>EOT timing</b>						
$t_{ELRL}$	EOT_N LOW to DMREQ LOW time		-	-	40	ns

EOT\_N is considered valid when DMACK\_N, RD\_N/WR\_N and EOT\_N are all LOW.

Fig 20. Burst DMA timing

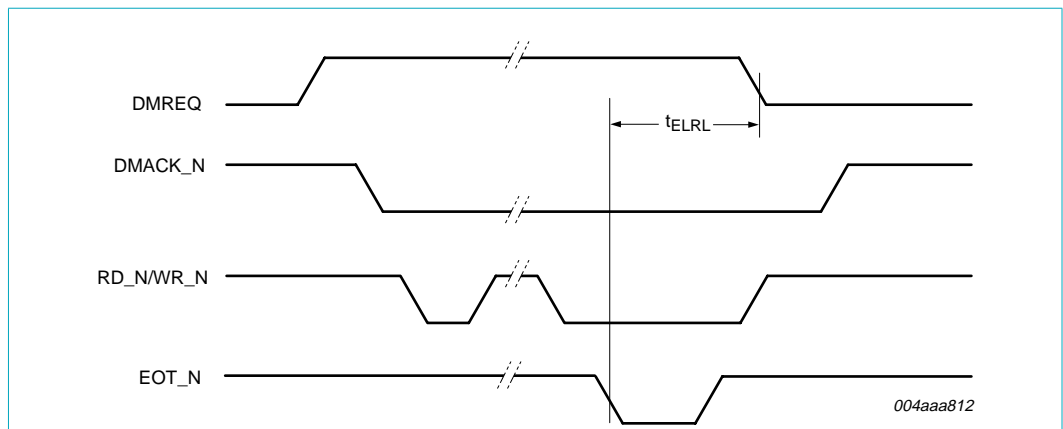

Fig 21. DMA terminated by EOT

## 17. Test information

The dynamic characteristics of the analog I/O ports (D+ and D-) as listed in [Table 16](#), were determined using the circuit shown in [Figure 22](#).

18. Package outline

SO28: plastic small outline package; 28 leads; body width 7.5 mm

SOT136-1

Fig 23. Package outline SOT136-1 (SO28)

TSSOP28: plastic thin shrink small outline package; 28 leads; body width 4.4 mm

SOT361-1

Fig 24. Package outline SOT361-1 (TSSOP28)

## 19. Soldering

### 19.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

### 19.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
  - for all BGA, HTSSON..T and SSOP..T packages
  - for packages with a thickness  $\geq 2.5$  mm
  - for packages with a thickness  $< 2.5$  mm and a volume  $\geq 350$  mm<sup>3</sup> so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness  $< 2.5$  mm and a volume  $< 350$  mm<sup>3</sup> so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

### 19.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;

- smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

## 19.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

## 19.5 Package related soldering information

**Table 19. Suitability of surface mount IC packages for wave and reflow soldering methods**

Package <sup>[1]</sup>	Soldering method	
	Wave	Reflow <sup>[2]</sup>
BGA, HTSSON..T <sup>[3]</sup> , LBGA, LFBGA, SQFP, SSOP..T <sup>[3]</sup> , TFBGA, VFBGA, XSON	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable <sup>[4]</sup>	suitable
PLCC <sup>[5]</sup> , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended <sup>[5][6]</sup>	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended <sup>[7]</sup>	suitable
CWQCCN..L <sup>[8]</sup> , PMFP <sup>[9]</sup> , WQCCN..L <sup>[8]</sup>	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note (AN01026)*; order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

[3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.

- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- [9] Hot bar soldering or manual soldering is suitable for PMFP packages.

## 20. Abbreviations

**Table 20. Abbreviations**

Acronym	Description
ACPI	Advanced Configuration and Power Interface
CPU	Central Processing Unit
CRC	Cyclic Redundancy Code
DMA	Direct Memory Access
DMAC	Direct Memory Access Controller
EMI	ElectroMagnetic Interference
FIFO	First In, First Out
ISO	Isochronous
MMU	Memory Management Unit
NAK	Not Acknowledged
OD	Open-Drain
PID	Packet Identifier
PLL	Phase-Locked Loop
POR	Power-On Reset
PSIE	Philips Serial Interface Engine
RAM	Random Access Memory
SCSI	Small Computer System Interface
SIE	Serial Interface Engine
SOF	Start-Of-Frame
USB	Universal Serial Bus

## 22. Legal information

### 22.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.semiconductors.philips.com>.

### 22.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. Philips Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local Philips Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

### 22.3 Disclaimers

**General** — Information in this document is believed to be accurate and reliable. However, Philips Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

**Right to make changes** — Philips Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — Philips Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of a Philips Semiconductors product can reasonably be expected

to result in personal injury, death or severe property or environmental damage. Philips Semiconductors accepts no liability for inclusion and/or use of Philips Semiconductors products in such equipment or applications and therefore such inclusion and/or use is for the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Terms and conditions of sale** — Philips Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.semiconductors.philips.com/profile/terms>, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by Philips Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

## 23. Contact information

For additional information, please visit: <http://www.semiconductors.philips.com>

For sales office addresses, send an email to: [sales.addresses@www.semiconductors.philips.com](mailto:sales.addresses@www.semiconductors.philips.com)

## 24. Tables

Table 1.	Ordering information	2
Table 2.	Pin description	4
Table 3.	Endpoint configuration	10
Table 4.	Command summary	11
Table 5.	Set Mode command, configuration byte: bit allocation	14
Table 6.	Set Mode command, clock division factor byte: bit allocation	15
Table 7.	Set DMA command: bit allocation	16
Table 8.	Read Interrupt register, byte 1: bit allocation	17
Table 9.	Read Last Transaction Status register: bit allocation	19
Table 10.	Error codes	19
Table 11.	Interrupt modes	22
Table 12.	Limiting values	23
Table 13.	Recommended operating conditions	23
Table 14.	Static characteristics (digital pins)	23
Table 15.	Static characteristics (AI/O pins)	24
Table 16.	Dynamic characteristics (AI/O pins; full-speed)	24
Table 17.	Dynamic characteristics (parallel interface)	25
Table 18.	Dynamic characteristics (DMA)	27
Table 19.	Suitability of surface mount IC packages for wave and reflow soldering methods	33
Table 20.	Abbreviations	34
Table 21.	Revision history	35
